Week 3 lab warmup cheatsheet

- task 1: wrong name

  error: NameError warning_at is not defined

warning_at is a parameter, not a function

  call the function: status_of(95, 90)

  or give it a default: warning_at=90

- task 2: scope

  error: NameError status is not defined

  status is local, gone when check ends

  return status inside the function

  catch it: result = check(87, 100)

  then print(result)

  ~~delete~~ first status line is not needed

- task 3: modules

  import math, then math.sqrt(16) gives 4.0

from math import sqrt means no dot

math also has pi, ceil, floor

fixing any error

read the last line first

NameError = spelled wrong or not in scope

TypeError = too few arguments

def alone does nothing, call it
